                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example: Page 77: 92pp; English.
This polypeptide comprises the human amyloid beta-protein precursor inhibitor (ABPI). The crystallographic structure of the complex of rat trypsin with ABPI was used as a template structure to model the structure of the substrate binding pocket of mouse mast cell protease 7 (mMCP-7, see W64233). The invention relates to mMCP-7 and related tryptase-7 proteases that can be used to prevent or inhibit fibrin clot formation. Such proteases can be used to treat disorders mediated by undesirable thrombus clot formation such as myocardial infarction and reocclusion following angioplasty of blood clots associated with pulmonary thrombombolism, deep vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MCP-7; mast cell protease 7; tryptase-7; serine protease; amyloid beta-protein precursor inhibitor; human; blood clot; anticoagulant; mycardial infarction; reocclusion; thromboembolism; cerebral embolism; thrombosis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequences database containing the relevant information acid sequences database containing the relevant information.

This sequence is used in the creation of adtabase containing the information for amino acid sequence of protein with at least 1 bological function with added a score on importance of expression of the biological information for each amino acid residue. The database is useful for determination of unknown biological function of a protein or polypeptide based on the homology of amino acid sequence, e.g. steric structure of protein, and includes retrieval and evaluation of high homologous relationship for the determination of mostly resembling protein. The database allows for correct and rapid retrieval and presumption of protein and polypeptide having biological functions.

Trypsinogen is synthesized in the actinar cells of the pancreas. Autocatalytic cleavage after Lys-6 leads to beta-trypsin by releasing a terminal hexapeptide. Subsequent cleavage after Lys-131 leads to alpha-trypsin. Further cleavage after Lys-176 yields pseudotrypsin. A cleavage may also occur after Lys-176 yields pseudotrypsin; A cleavage may also occur after Arg-105. TION #superfamily trypsin; trypsin homology hydrolase; pancreas; protein digestion; serine proteinase;

-!- SUBCELLULAR LOCATION: EXTRACELLULAR.
-!- TISSUE SPECIFICITY: HIGH LEVELS ARE SEEN IN THE PANCREAS WHILE LOWER LEVELS ARE FOUND IN THE LIVER, SPLEEN AND THYMUS.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE; 95251611.

Mean 40.858; Variance 64.854; scale 0.630

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel human prostate specific tumour protein and fragments - useful Novel human prostate specific tumour protein and fragments - useful Lor detecting and treating prostate cancers

Example 1; Page 87-89; 141pp; English.
This sequence is encoded by a human prostate tumour specific gene, and and be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                       08-DEC-1998 (first entry)
Prostate tumour specific gene clone L1-12 protein.
Prostate tumour specific gene; human; prostate cancer; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CAGGCATCACCTATGTGCCGCCTCTGCTGGAAGTGGGGGGTAGAGGAG 433

Polypeptides comprising immunogenic portions of prostate proteins -
Polypeptides comprising immunogenic portion of a prostate tumour
Example 1; Page 82-84; 130pp; English.
The present sequence is an immunogenic portion of a prostate tumour
Protein. The immunogen, or the DNA encoding it, can be used as a
vaccine for the treatment of prostate cancer. The immunogen was
solated from a prostate tumour cDNA library obtained by subtracting
a prostate tumour cDNA expression library with a normal tissue cDNA
library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1834 CCAGTCTGTCACTGCCTATATGGTGTCTGCCGCAGGCCTGGGTCTGGTCG 1883

CC gene. The sequence is derived from overlapping clones V71166-79. The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target pS108 polynucleotide. The products can be used for detecting, diagnosing, proventing, monitoring, producistics can be used conditions of treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, procured the new be used in drug screening and gene therapy.
Protein encoded by the consensus sequence of the PS108 gene. PS108 gene; protein encoded by the consensus sequence of the PS108 gene; prostate disease; benign prostatic hyperplasia; BPH; prostatitis; prostatic intraepithelial neoplasia; PIN; cancer; drug screening; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1427

Protein polymers comprising repeating units and sequences - capable of enzyme-catalysed covalent bond formation useful as a biocompatible material for wound closure and tissue repair biocompatible material for wound closure and tissue repair armanle 4.7 Page 45. 138pp; English.

The amino acid sequence of the protein polymeric adhesion substrate (PPAS) 1-B. The protein comprises 10 repeats of the PPAS1-B mnonweric repeat (R80326) which consists of the CLP 3.7 gene encoded sequence (R80311) linked to the human fibrin cross-linking substrate peptide 93.2 sequence (R80316). The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18-APR-1996 (first entry)
Protein polymeric adhesion substrate 1-B.
Protein polymeric adhesion substrate 1-B.

This sequence represents a unnatural collagen-like polymer of the invention. The products may be used as films, fibres, moulded of the invention. The products may be used as films, fibres, moulded of the invention. The products may be used as films, labware or other surfaces, e.g. prosthetic devices. The polymers may be used for binding a wide variety of specific binding materials, as catalytic substances (where the amino acid sequence may specifically chelate a wide variety of elements), as purification media, composites, laminates or adhesives. They may also be combined with introcellulose, etc., as flask coatings or in synthetic matrices for the growth and study of cells, as affinity columns or as supports for biological materials. The polymers have collagen-like properties, but may be easily expressed in micro-organisms in high efficiency. The new sequences can be tailored to give the desired properties. Recombinant collagen-like polymers - useful for making gels, films, 2210 21102251 2209 GGCCTCCCTGTATAAGTCCAGACTGAAACCCCCTTGGAAGGCCTCCAGTC 2160 144 lyLeuPro...GlySerProGlyAlaProGlyThrProGlyGluGlyGln 159 Collagen-like polymer. The amino acid sequence of the protein polymeric adhesion substrate (PRAS) 1-A. The protein comprises 10 repeats of the PRAS1-A monomeric repeat (R80323) which consists of the CLP 3.7 gene sequence linked to the human fibrin cross-linking substrate sequence (see Q98704) corresponding to the wild type 17 C-terminal amino acids from human fibrin. The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair.
18-APR-1996 (first entry)
Protein polymeric adhesion substrate 1-A.
Protein polymeric adhesion substrate 1-A.
Pendent group; repeating unit; enzyme recognition site; sealant; fibrin; enzymatic cross-linking; biocompatible material; structural integrity; medical adhesive; wound closure; tissue repair; transglutaminase.
Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1965 CCCAATGTGCTGGAAGTTTTCTACGCTGAGTATTTGGCCAAGTCGCTCTT 1916

PT preparation of synthetic repetitive DNA - useful for construction of large protein polymers having repeating units, used in structural properation, e.g. synthetic silk. PS material, e.g. synthetic silk. PS Example 6; Pages 83; 127pp; English. CC on plasmid pPT0321, used in the method of invention, which involves the preparation of synthetic DNA sequence having repeating units from about 3-15 codons and encoding a protein of at least about 30 kba. CC The method is useful for the production of high molecular weight CC polymers (e.g. synthetic silk), either nucleic acids or peptides that care the expression products of the nucleic acids and particularly high colours materials. CC structural materials. PR Recombinant collagen-like polymers - useful for making gels, films, fibres, etc.

Frample 7: Column 50: 93pp: English.

C This sequence represents a unnatural collagen-like polymer of the invention. The products may be used as films, fibres, moulded c objects and admixed with other natural or synthetic polymers or coatings con fibres, films, labware or other surfaces, e.g. prosthetic devices. The polymers may be used for binding a wide variety of specific binding c materials, as catalytic substances (where the amino acid sequence may c specifically chelate a wide variety of elements), as purification media, composites, laminates or adhesives. They may also be combined with incoellulose, etc., as flask coatings or in synthetic matrices for the corporation materials such as carbon fibres, nylon fibres, convert and study of cells, as affinity columns or as supports for the biological materials. The polymers have collagen-like properties, but may columne can be easily expressed in micro-organisms in high efficiency. The new sequences can be tailored to give the desired properties.

New recombinant protein polymers - containing naturally occurring repetitive units for crosslinking by enzymes, useful as medical and estates and sealants, depots and matrices adhesives and sealants, depots and matrices Example 4: Column 26: 70p; English.

Example 4: Column 26: 70p; English.

Example 4: Column 26: 70p; English.

Protein polymer adhesive substrate PPASI-A comprises 10 repeats of a monomer (see W49712) consisting of human fibrin gamma chain peptide (aa421-437) inserted into a structural backbone of collagen repeat motifs (see W49711). The 68 kDa PPASI-A polymer has been expressed in Escherichia coll Hablol transformants using plasmid pPT0321. Claimed recombinant protein polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength.

CLP (collagen like protein) polymers are extremely soluble in water, allowing protein solutions of over 10 wt.% to be formed while maintaining good flow properties. CLP polymers have good adhesion to hydrophilic surfaces and therefore may adhere well to tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2347 GGGAAACCAGGTGACTGAGTTTATTCAGCTCCCAAAAACCCTTCTCTAGG 2298

Example 4; Page 47; 138pp; English. CC The amino acid sequence of the protein polymeric adhesion substrate CC (PPAS) 1-C. The protein comprises 10 repeats of the PPASI-C monomeric CC (PPAS) 1-C. The protein comprises 10 repeats of the PPASI-C monomeric CC (R80321) linked to the human fibrin cross-linking substrate peptide CC (R80321) linked to the human fibrin cross-linking substrate peptide CG 93-4 sequence (R80317). The polymers can be used in biological systems where in situ formation of a biocompatible material with structural CC integrity is required e.g. as medical adhesives and sealants or for wound CC closure or tissue repair. Example 7: Column 53: 93pp; English.

Example 7: Column 53: 93pp; English.

This sequence represents a unnatural collagen-like polymer

This sequence represents a unnatural collagen-like polymers

of the invention. The products may be used as films, fibres, moulded

colpects and admixed with other natural or synthetic polymers or coatings

on fibres, films, labware or other surfaces, e.g. prosthetic devices. The

polymers may be used for binding a wide variety of specific binding

materials, as catalytic substances (where the amino acid sequence may

specifically chelate a wide variety of elements), as purification media,

composites, laminates or adhesives. They may also be combined with

composites, laminates or adhesives carbon fibres, nylon fibres,

increallulose, etc., as flask coatings or in synthetic matrices for the

growth and study of cells, as a affinity columns or as supporties for

polymers as affinity columns or as supporties,

be easily expressed in micro-organisms in high efficiency. The new

sequences can be tailored to give the desired properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant collagen-like polymers - useful for making gels,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2180

New recombinant protein polymers - containing naturally occurring repetitive units for crosslinking by enzymes, useful as medical adhesives and sealants, depots and matrices adhesives and sealants, depots and matrices.

Tample 4: Column 29: 70pp: English.

Example 4: Column 29: 70pp: English.

Protein polymer adhesive substrate PPASI-C comprises 10 repeats of a monomer (see W49716) consisting of human fibrin gamma chain peptide 93.4 (see W49706) inserted into a structural backbone of collagen repeat motifs (see W49711). The 59 kDa PPASI-C polymer has been expressed in Escherichia coli HB101 transformants using plasmid ppr0322. Claimand recombinant protein polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength. CLP (collagen like protein) polymers are extremely soluble in water, allowing protein solutions of over 10 wt.% to be formed while maintaining good flow properties. CLP polymers have good aphesion to hydrophilic surfaces and therefore may adhere well to
                                                                                                                                                                                                                                                                                                                                                            a.....proglyThrProglyProglnG 577
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        224

Protein polymers comprising repeating units and sequences - capable of enzyme-catalysed covalent bond formation useful as a brocenin polymers compatible material for wound closure and tissue repair biocompatible material for wound closure and tissue repair

Bramphe 4: page 43: 188pp: English.

The amino acid sequence of the protein polymeric adhesion substrate (PPAS) 1-A. The protein comprises 10 repeats of the PPAS1-A monomeric (PPAS) 1-A. The protein comprises 10 repeats of the PPAS1-A monomeric comman fibrin cross-linking substrate sequence (see Q98704) corresponding to the wild type 17 C-terminal amino acids from human fibrin. The polymers can be used in biological systems where in situ formation of a polymers can be used in biological systems where in situ formation of a medical adhesives and sealants or for wound closure or tissue repair.
